OVERVIEW

Unusable cordless power drills with dead batteries take up space but have useful hardware. This is important to reduce waste and generate quantifiable energy using available drill mechanisms.

Requirements

- Charge a 12V battery
- **Battery management**
- Thermal protection
- Characterize mechanical and electrical energy within system

Experimentation and Concepts

The method of energy generation is modeled after windmills and waterwheels, which have a general efficiency of around 20-40% due to drag and air resistance.

Charge Rate

Given a constant input rotation of 300 RPM it will take approximately 3.9 hours to charge the battery from 10% to 100% 7 aH /1.8 A= 3.89 hours

Gear 1: 32 teeth Gear 2: 16 teeth Gear 3 & 4:25 teeth

 $32 \rightarrow 16 = 25 \rightarrow 25$ Gear 1 to Gear 2 Gear 2 is on same shaft as Gear 3 Gear 2 to Gear 3

Input: 204rpm * (32T/16T) = 408 rpm Both drills supplied with 408 rpm

Final Design Description

80/20 aluminum, 3D printed hubs and housings. recycled cordless drills, DC incline meters, and a solar charge controller were used to create a compact but efficient design that would allow us to charge a 12V 7.2 A sealed lead acid battery.
