Technology moving forward...

Tim Hanley, Deloitte

Shifts driving Industry 4.0

Digital-Physical Link

- **Additive Manufacturing (3D Printing)** becomes cheaper, more available and relevant for new materials
- **Next-generation of robots** that are intelligent, adaptive, connected and collaborative with humans

Human-Machine Interfaces

- Mass adoption of **advanced user interfaces** (touchscreens, wearables...)
- Introduction of new technologies and application in **Virtual and Augmented Reality**

Analytics and Artificial Intelligence

- Breakthroughs in **Artificial Intelligence** and **Machine Learning**
- Sophisticated and rapidly-developing **algorithms leverage increased accessibility** to quality data

Data Creation, Storage and Connectivity

- Sharp fall in the prices of **data storage, computing power and bandwidth**
- Massive advancements in **cloud-based** computing platforms
- **Sensor prices** continuously dropping

Cheaper

Faster

Smarter

Digital Manufacturing Technology Trends

Standards and Technology
U.S. Department of Commerce

PLM – a key element to digital enterprise

The digital product definition forms the core of how product information is moved through this sociotechnical system.

- However, still sequential
- Dynamic model re-purposing still lacking
- MBD must move beyond shape
- Lifecycle loop still not connected

www.purdue.edu/plm

The communications spectrum...

A complete MBD supports lifecycle communication

BEHAVIOR

3.

| Property | Test Standard DIN/ON EN ISO | corr.to ASTM | Unit | Value | Testing Frequency |

MBE and the Digital Twin

MODEL-BASED DEFINITION

Multiple Connected Representations

DIGITAL TWIN

By comparing digital product data to the physical performance of the object, variation can be tracked and used to inform design of next-generation products, develop predictive modeling and validation schemes for products, and to diagnose and solve problems that occur.

Clearing up some vocabulary...

- A **model-based enterprise** (MBE) is an **environment**. It is an organization that has transformed itself to leverage model-based information in its various activities and decision-making processes. In this environment, the model serves as a dynamic artifact that used by various authors and consumers of information for their respective tasks. The MBE embraces feedback from the various lifecycle stages to improve the model representation for the creation of subsequent products and product iterations. People working within the enterprise have an enlightened view of digital product information that can be leveraged in their daily work.
- **Model-based** _____ (MBx) Model-based engineering (MBe), model-based manufacturing (MBm), model-based sustainment (MBs), and any other model-based [fill in the blank] (MBx) are categories of **activity** within the model-based enterprise. Any of these activities (and the people in them) use digital product data to represent shape, behavioral, and contextual information carried by the model-based definition to execute their functional role. Model-based activities are conducted by relying on the predictive and archival capabilities of the model, by replying on its high levels of fidelity to physical object or system.
- A **model-based definition** (MBD) is a **thing**. It is a digital representation (artifact) of an object or system. It is representative of the physical object or system and all of its attributes, and is used to communicate information within various MBx activities in a model-based enterprise. The MBD is rich in information – shape, behavior, and context – and it travels the information architecture within an enterprise (including its extended supply chain and customers), providing input to the various authors and consumers who need it. The model-based definition is analogous to the *digital twin*, although most people today do not think of it in such broad view. And the *digital thread* is the combination of the MBD and the IT architecture that connects the various functional areas of the model-based enterprise.

A changing workforce...

Tim Hanley, Deloitte

Advanced technologies will increase the skillsets required
...and potentially drive companies to explore different talent models

As Skill Requirements Increase, More Manufacturing Jobs Go Unfilled

(WSJ, Sep 2016)

New Manufacturing Jobs Require New Manufacturing Skills—It's That Simple

(AutoDesk, May 2017)

Automation Will Lead To Collaboration Between Man And Machine

(Forbes, Jul 2017)

A Robot Can Be a Warehouse Worker's Best Friend

Companies are racing to develop 'collaborative' robots, which are relatively cheap and can boost employees' productivity

(WSJ, Aug 2017)

Trends

- Aging population
- Shortage of manufacturing talent
- Exponential technologies
- Gig economy / open talent
- Rapid product cycles

This next industrial revolution is about the combination of man & machine, not the replacement of one for the other.
